Center clone name: 158 A. 6
Sequencing vector: Plasmid: n/a; 100% of reads
Sequencing vector: Plasmid: n/a; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 150558 bases at least Q40
Consensus quality: 150654 bases at least Q20
Insert size: 151000; agarose-fp
Insert size: 151000; agarose-fp
Quality coverage: 11.8 in Q20 bases; sum-of-contigs
Quality coverage: 11.8 in Q20 bases; sum-of-contigs arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved. NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is 33517: contig of 33517 bp in length 33617: gap of 100 bp 42736: contig of 9119 bp in length

consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
   This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP to phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, testenosis, cardiac hypertrophy, immune disorders and inflammation. This polymucleotide sequence is human KID DNA (SeqID 7) encoding a full length KID enzyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               720
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               780

The invention microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated Arpase activity, a method of testing. For Arpase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target proteins, methods to identify candidate agents that bind to a target or protein or act as a modulator of the binding characteristics or concern, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating callular complexity of modulators of motor proteins useful for treating callular complexity immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating autoimmune disorders as associated with KID and for inhibiting KID and for treating autoimmune disorders associated with KID and for inhibiting KID and for treating autoimmune diseases, arthritis, graft rejection, inflammatory bowel disease and proliferation induced after medical procedures including surgery and and poplasty. This sequence represents DNA encoding a human microtubule company and contor protein of the invention. invention relates to human microtubule motor proteins and the nucleic 240 360 AGGGTGGCTGTGCGACTGCGGCCATTTGTGGATGGAACAGCGGGAGCAAGTGATCCCCCC 120 120 TGTGTGCGGGGCATGGACAGCTGCTCTTAGAGATTGCTAACTGGAGGAACCACCAGGAG 180 180 240 300 GCAGGTTCAGTGCAGCCCATCCTAAGGCACTTGCTGGAAGGGCCAGAATGCCAGTGTGCTT 300 9 9 ATGGTCGCTGTCGCTAAGCAAGATTGGAGCTACTCGTCGTCCACCTCCAGCTCGCGTA ATGGCTCCTGTCGCTAAGCAAGATTGGAGCTACTCGTCGTCCACCTCCAGCTCGCGTA ACTCTCAAATACCAGTTTGATGCCTTCTATGGGGAGAGGAGTACTCAGCAGGACATCTAT GCAGGTTCAGTGCAGCCCATCCTAAGGCACTTGCTGGAAGGGCAGAATGCCAGTGTGCTT AGGGTGGCTGTGCGACTGCGGCCATTTGTGGATGGAACAGCGGGAGCAAGTGATCCCCCC ACTUTCAAATACCAGTTTGATGCCTTCTATGGGGAGAGGAGTACTCAGCAGGACATCTAT GCCTATGGACCCACAGGAGCTGGGAAGACGCACACAATGCTGGGCAGCCCAGAGCAACCT Gaps 241 241 301 301

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polynucleotide sequence is human KID DNA (SeqID 3) encoding a full length
                                                                                                                                                                                                                                                                                                                                                                                                      /transl except= (pos: 4. .5; aa: Pro)

activity, a method of testing for Arpase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target cancer, hyperplasias, restencesis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with Kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restences, cardiac hypertrophy, immune disorders and inflammation, for treating autoimmune associated with KID and for inhibiting KID and for treating autoimmune associated with KID and for inhibiting KID and for treating autoimmune diseases, arthritis, graft rejection, inflammatory bowel disease and comproplasty. This sequence represents DNA encoding a human microtubule motor protein of the invention. Note: The specification states that this expense the protein featured as SEQ ID NO:4, but this does not

```
The present invention describes a method for modulating the expression of a thantos (dasth)-associated protein (THAP) responsive gene. The method comprises modulating the interaction of a THAP-family polypeptide or its biological fragment with a mucleic acid, and so enhancing or repression the expression of the THAP responsive gene. Also described (1) a method of modulating the expression of a gene responsive to a THAP responsive complex; (2) a pharmaceutical composition comprising a THAP responsive comprising a transcription factor decoy described above, (5) methods of the polypeptide or its piological fragment, or a mucleic acid and a THAP-family polypeptide or its piological fragment; (3) a transcription factor decoy described above, (5) methods or its piological fragment; or a mucleic acid and a THAP-family polypeptide or its piological fragment or a mucleic acid and a THAP-family polypeptide or its piological fragment; (6) a weetor packaging cell line complex; (6) a vector packaging cell line complex; (7) a method of constructing a cell which expresses a combinant THAP-family polypeptide; (9) a method of ameliorating recombinant THAP-family polypeptide; (9) a method of ameliorating combinant into the nucleus; (10) methods for reducing the symptoms associated with a condition mediated by a THAP/chemokine complex; (9) methods of identifying a test compound that modulates transcription complex; (10) methods for reducing the symptoms associated with a condition mediated by a THAP/chemokine or an insufficient apoptosis; cardiovascular disease and meurodegenerative or insufficient apoptosis; cardiovascular disease and meurodegenerative or insufficient apoptosis; cardiovascular disease and meurodegenerative or insufficient apoptosis; cardiovascular disease and meurodegenerative comprising a THAP-family polypeptide in an individual; or comprising a THAP responsive promoter; (12) a genetically engineered by a THAP-family polypeptide or a THAP-family polypeptide in an individual; (11) a mentod or comprising a THAP r
                                                                                                                                                                                                                                                                                                                                                   responsive gene for preventing or treating e.g. cancer or inflammation, comprises modulating the interaction of a THAP polypeptide with a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              jiogenesis, inflammation, metastasis of a cancerous tissue, excessive insufficient apoptosis, cardiovascular disease or neurodegenerative seases. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                  expression of a Thanatos (death) - Associated Protein (THAP)

The invention elates to novel isolated, enriched or purified nucleic acid molecules encoding a kinase polypeptide. The mucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a comprise an aturally occurring kinase polypeptide; (d) encodes the encodes a naturally occurring kinase polypeptide; (d) encodes the conspected in (a), except that it lacks one or more, but not all, of an N-terminal domain, C-terminal catalytic domain, a catalytic domain, a C-terminal domain, a coiled-coil structure region, a spacer region and a C-terminal tail; or (e) is a complement of (d). The nucleic acid molecules, polypeptides, methods and substance are useful for treating cancers, immune-related diseases or disorders, cardiovascular disease, brain or neuronal-associated diseases, and metabolic disorders. The disorders are conscretably cancers, cardiovascular disease, brain or neuronal or peripheral nervous system, Alzhaimer's diseases of the central or peripheral nervous system, Alzhaimer's diseases of the central or peripheral nervous system, Alzhaimer's diseases of conterior, infections, infections caused by prions, infections caused by kinds, ocular diseases, migraines, pain, excert in infections, infections caused by prions, infections caused by kinds, ocular diseases, migraines, pain, excert in the contern of the invention, general disorders, diseases, migraines, pain, expected disorders, diseases, migraines, pain, exception. This sequence corresponds to the DNA encoding one of the cyx, in the content of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                               AAPI5566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointesting, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and profilerative disorders, wounds, and infectious diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using motor phosphate. Furthermore readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polynucleotide sequence is human KID DNA (SeqID 5) encoding a full length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        encoding the human kinesin-like DNA binding protein (KID) (SeqID 5)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ATGGGTCGCTGTCGGCTAAGCAAGATTGGAGCTACTCGTCGTCCACCTCCAGCTCGCGTA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ATPases activity, a method so festing for ATPases activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders as associated with KID and for inhibiting KID and for treating autoimmune disorders such inflammation, for treating disorders as associated with KID and for inhibiting KID and for treating disorders proliferation induced after medical procedures including surgery and proliferation induced after medical procedures including surgery and angloplasty. In sequence represents DNA encoding a human microtubule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated microtubule motor protein, useful for screening modulators for treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation.
                                           Human; microtubule motor protein; gene; de; cellular proliferation disorder; cancer; hyperplasia; restenosis; cardiac hypertrophy; immune disorder; inflammation; kinesin-like DNA binding protein; KID; autoimmune disease; arthritis; graft rejection; inflammatory bowel disease; angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 1041;

Specifically, it refers to candidate agents that are capable of modulating the activity of traget proteins having motor or phosphate. Furthermore, this activity of an indirectly produces ADF or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therenosis, cardiac hypertrophy, immune disorders and inflammation. This polynucleotide sequence is human KID DNA (SeqID 1) encoding a full length KID enzyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated Arpase activity, a methods of testing for Arpase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenoois, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders and inflammation, for treating autoimmune disorders and inflammation, for treating autoimmune disorders and inflammation, for treating autoimmune disorders and inflammatory bowel disease and proliferation induced after medical procedures including surgery and anglophasty. This sequence represents DNA encoding a human microtubile motor protein of the invention of the invention when the contents and inflammatory bowel disease and propolatory and the anglophasty. This sequence represents DNA encoding a human microtubile.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 123

The invention relates to new polymucleotides and polypeptides, useful for diagnosis and treatment of breast, lung and colon cancer. The sequences can be used in detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous. They can also be used to inhibit tumour growth by modulating expression of a gene product. AAS36943-AAS39333 represent novel human diagnostic and therapeutic coding sequences of the invention
                                                                                                                                                                                                                                                               1356 AGAGAAGGACCTAGAGATTGAGAGGCTTAAGACGAAAGCAAAAAGAACTGGAGGCCAAGAT 1415

Also included are an expression vector comprising the polymucleotide operably linked to an expression vector of; an isolated cell transformed or transfected with an expression control sequence; a host controlectide operably linked to an expression vector of; an isolated cell transformed or transfected with an expression vector of; an isolated controlectide is method for detecting the presence of a cancer in a patient of a fusion protein comprising at least the polympetide; an operately of component conditions; a method for stimulating and/or expanding T cells stringent conditions; an isolated T cell population of arriers and immunostimulants, and a second component selected from the polymucleotides, proteins, antibodies, fusion component selected from the polymucleotides, proteins, antibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polymetion reagent consisting of arriers and immune response or treating to proteins, T cell populations and antigen presenting cells expressing the compositing at least one of the oligonucleotide of, or an antibody and a detection reagent consisting of a reporter group. The polymeptides are useful as vaccines for the treatment or prevention of polymucleotides are useful as vaccines for the treatment or prevention of ung cancer, and for diagnosis and monitoring of such cancer. The polymucleotides may be used as probes or primers for mucleotides con an integer presenting cells con the public transfer or an integer or treating colling the preparesion of tunour polypeptides or an antibody and a colling thing expression of tunour polypeptides or an expect or tunour polypeptide and antigen presenting cells con the preparation of the oligonucleotides may be used as probes or primers for mucleic acid for the preparati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1055

determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, or chromosome and gene mapping, in the recombinant production of protein, or in generating antibodies specific for it. The present sequence is useful for generating antibodies specific for it. The present sequence is one the 38043 isolated cDNA/RST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence. The sequence contained in electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     395

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 15; SEQ ID NO 10603; 80pp; English.

The invention relates to a mucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide superences in the specification, or their complements or fragments, and sequences in the specification. The probe is a single exon probe that this defined in the specification. The probe is a single exon probe that this fartingency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-defensable set of single exon nucleic acid probes for measuring human gene expression, comprising a plurality of single exon nucleic acid molecule or and addressably isolatable or amplifiable from the plurality), a single ox measuring human gene expression, a method of measuring human gene expression, a vector comprising the single exon nicroarray for measuring human gene expression, a vector comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid of any of the above-mentioned amino acids of any of the above-mentioned amino acid sequences (optionally with conservative amino acid substitutions), an isolated antibody that binds specifically to a peptide cited above, can calso measure gene expression, a method of provading exon probes or solution and an expression data by subscription, and a computer-readable catorage medulum which contains a database having a plurality of records catorage medulum which contains a database having a plurality of records catorage medulum which contains a database having a plurality of cords catorage medulum which contains a database having a plurality of seconds cited above. The probes methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying cated above. The probes are used in identifying and contains a database having a plurality of cords in addition, the probes are used in identifying and contains a laterations in the genomic locus that included second or in expressing the ORF-encoded peptide. The sequence are setul in an human sin the form part of the printed specification, but was obtained seqdata.uspto.gov/sequence.html?DocID=20030194704 directly from USPTO

domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 2) of the invention.
                                                                                                                                                                                                                                                            9

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or protein, and methods of a target protein, modulators of the target protein, and methods of treating callular proliferation disorders such so cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor protein useful for treating callular corpliferation disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating autoimmune diseases, arthritis, graft rejection, inflammatory bowel disease and cases associated with KID and for inhibiting KID and for treating succise of the invention. Note: The specification states that this sequence is encoded by the nucleic acid featured as SEQ ID NO:1, but this does not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention elates to novel isolated, enriched or purified nucleic acid molecules encoding a kinase polypeptide. The nucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a complement of (a); (c) hybridizes under stringent conditions to (a) and complement of (a); (c) hybridizes under stringent conditions to (a) and conditions to (b) and complement of complement of all of encodes the conditions of terminal domain, a C-terminal catalytic domain, a catalytic domain, a C-terminal domain, a coiled-coil structure region, a spacer region and a C-terminal domain, a coiled-coil structure region, a spacer region and a C-terminal tail; or (e) is a complement of (d). The nucleic acid molecules, polypeptides, methods and substance are useful for treating cancers, immune-related diseases or disorders, cardiovascular disease, brain or curronal-associated diseases, and metabolic disorders. The disorders are preferably cancers of the tissues or of hematopoietic origin, diseases of the central or peripheral nervous system, Alzheimer's disease, by multiple sclerosis, amyotrophic lateral sclerosis, viral infections caused by fund; ocular diseases, migraines, pain, bacteria, infections caused by prions, infections caused by fund; ocular diseases, migraines, pain, catal tide disorders, dyskinesias, metabolic disorders and organ transplant crejection. This sequence corresponds to one of the kinase polypeptides of
                                                                                                                       antiparkinsonian; immunomodulator; cardiant; neuroprotective; nootropic; antiparkinsonian; virucide; antibacterial; fungicide; ophthalmological; analgesic; hypotensive; immunosuppressive; kinase inhibitor; kinase; cancer; peripheral nervous system; central nervous system; Alzheimer's disease; Parkinson's disease; multiple sclerosis; amyotrophic lateral sclerosis; viral infection; prion infection; ocular disease; migraine; pain; sexual dysfunction; mood disorder; attention disorder; cognition disorder; hypotension; hypotension; psychotic disorder; neurological disorder; dyskinesia; metabolic disorder; organ transplant rejection; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated, enriched or purified nucleic acid molecule encoding a kinase polypeptide, useful for treating cancer, immune-related diseases, cardiovascular disease, brain or neuronal-associated diseases and

the expression of the THAP responsive gene. Also described: (1) a method complexity (2) a pharmaceutical composition comprising a redulating the expression of a gene responsive to a THAP responsive clement in a pharmaceutical composition comprising a central composition comprising a cell meant in a pharmaceutical composition factor decoy comprising a transcription factor decoy described above; (5) methods of comprising a transcription between a nucleic acid and a THAP-family polypeptide or its biological fragment, or a nucleic acid and a THAP-family polypeptide or its biological fragment, or a nucleic acid and a THAP-family polypeptide or its biological fragment; (7) a method of constructing. CC c a nucleic acid encoding a THAP-family polypeptide or its biological crecombinant THAP-family polypeptide; (8) a method of ameliorating symptoms associated with a condition mediated by a THAP-family polypeptide or its biological crecombinant THAP-family polypeptide; (8) a method of ameliorating symptoms associated with a condition mediated by a THAP-family polypeptide in a nindividual; or a transcription at a THAP responsive element or that modulates the transcription associated with a condition selected from excessive or insufficient apoptosis, cardiovascular disease and neurodegenerative corporated with a condition selected from excessive or insufficient apoptosis, cardiovascular disease and neurodegenerative comprising a THAP-family polypeptide in an individual; (11) a cartivity of a chemokine or a THAP-family polypeptide in an individual; (11) a mediated by a THAP-family polypeptide in an individual; (11) a cartivity or and product; (12) a genetically in the responsive promoter comprising a THAP-family polypeptide or its biological fragment; (13) an in vitro transcription comprising a nucleic acid comprising a THAP responsive and osteopathic acid comprising a nucleic acid comprising a the vector described above or that expresses a a THAP-family confused modulating the expression of anther accomposition has antiangl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    angiogenesis, inflammation, metastasis of a cancerous tissue, excessive or insufficient apoptosis, cardiovascular disease or neurodegenerative diseases. Internation disorders. Specifically, it refers to candidate agents that proliferation disorders. Specifically, it refers to candidate agents that dear capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using or phosphate. Furthermore readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This

This invention relates to a novel method for high throughput

restenosis, cardiac hypertrophy, immune disorders and inflammation. Tropolypeptide sequence is human KID protein (SeqID 4) of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating callular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like pNA
                                                                                                                                                                        181

binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulacors of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating autoimmune diseases, arthatis, graft rejection, inflammatory bowel disease and proliferation induced after medical procedures including surgery and angioplasity. This sequence represents a human microtubule motor protein of the invention. Note: The specification states that this sequence is encoded by the nucleic acid featured as SEO ID NO:3, but this does not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             182
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          241

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                           in surventure trades to a mover merical tradement of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 6) of the invention.

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for addulators of a motor protein which has microtubule stimulated ATPase activity, a method of testing for ATPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for creating for modulators of motor proteins useful for treating disorders and inflammation fiscates and inflammation for treating disorders and inflammation for treating disorders and inflammation, for treating disorders and inflammation, for treating disorders and inflammation, for treating disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders and inflammatory bowel disease and proliferation induced after medical procedures including surgery and proliferation induced after medical procedures including surgery and and proliferation induced after medical procedures including surgery and contraction and an analysis and the medical procedures including surgery and and proliferation induced after medical procedures including surgery and and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis and an analysis an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAP15566 to AAP16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polymucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polypeptide sequence is human KID protein (SeqID 8) of the invention.

acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target cancer, hyperplasias, restencing callular proliferation disorders such as cancer, hyperplasias, restencist, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating callular proliferation disorders such as cancer, hyperplasias, restences; chypertrophy, immune disorders and inflammation, for treating autoimmune associated with KID and for inhibiting KID and for treating autoimmune diseases, arthritis, graft rejection, inflammaticy howel disease and chimibiting KID and for treating autoimmune casociated with KID and for inhibiting KID and for treating autoimmune diseases, arthritis, graft rejection, inflammaticy bowel disease and proliferation induced after medical procedures including surgery and angioplasty. This sequence represents a human microtubule motor protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   265

                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide or as a probe for useful in gene therapy. An odeveloping a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM0759-ADM06201 encoded by the polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PISSPADPERHFLPASRNRTVGATRLNORSSRSHAVLLVKVDORERLAPFRO--REGKLY
